

UFIPOLNET: Concentration of Particle Number Distributions at 4 Stations in Europe

H. Gerwig^{1*}, G. Löschau¹, L. Hillemann², B. Wehner³, A. Wiedensohler³, A. Zschoppe⁴, C. Peters⁴, A. Rudolph⁴, C. Johansson⁵, J. Cyrys⁶, M. Pitz⁶, R. Rückerl⁶, J. Novák⁷, H. Horn⁸, R. Caldow⁸, G. Sem⁹

WHY ULTRAFINE PARTICLES?

- Epidemiological studies show relationships between high concentrations of PM₁₀ and adverse health effects, like heart attacks and premature deaths. It is suggested, that ultrafine particles (UFP) are of importance in this contexts. The EU needs therefore more information about UFP concentrations within CAFE process and the Thematic Strategy on Air Pollution.
- Several studies show a decline of particle mass concentrations in Central Europe of TSP and PM₁₀ during 1990-99. But particle number concentrations of ultrafine particles (< 100 nm = UFP) partly raised during winter periods 1991 – 1999 in Erfurt/Germany (Cyrys et al. 2002).
- Ultrafine particles are measured in only a few routine measuring stations in Europe.

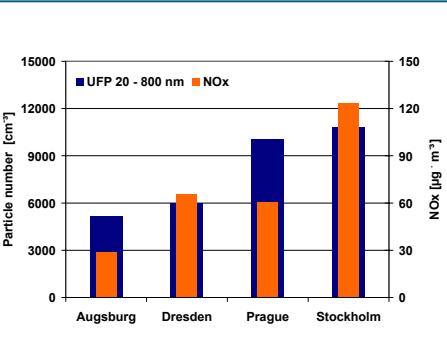

Fig. 1 Mean particle number concentrations and NO_x on hourly basis at 4 measuring stations, June 2007.

Fig. 2 Dresden: UFP 330, TOPAS (middle) and reference Twin-DMPS, IFT (right)

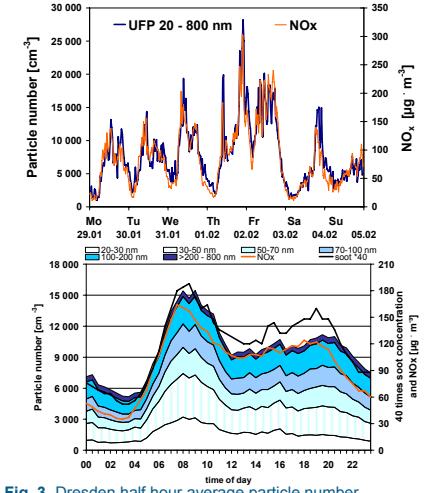

Fig. 3 Dresden half hour average particle number concentrations UFP 330 compared to NOx, soot one week time series 29/1 – 4/2/2007
a b average weekday 24/1 – 19/3/07

OBJECTIVES

- Measuring instrument for ultrafine particle size distributions (UFP 330 by TOPAS GmbH)
 - Affordable and easy to use under routine measuring network conditions
 - No butanol or radioactive wastes
 - 6 different size classes (UFP1 - UFP6) >20 | >30 | >50 | >70 | >100 | >200nm (-800nm) therefore reduced data amount
- Harmonisation of sampling conditions
- Measuring activities over 5 years
- Contact with interested groups, like CAFE-Working group and VDI
- Long term stability will be tested in Jan 08

RESULT: UFP 330

- UFP 330 (Fig. 2) consists of a corona-jet-charger, a DMA, an electrometer (Hillemann et al., 2007).
- Same sampling system at all sites (1 µm cyclone and membrane dryer), different data collecting systems and different communication protocols (Zschoppe et al., 2007).

RESULT: 4 STATIONS COMPARED

- UFP particle number concentrations + NOX (1 hour average) at 4 measuring stations in June 2007. (Fig. 1)
- Urban background site Augsburg shows less, street canyon Stockholm shows twice as many particles as Dresden. NOx in Prague and Dresden show almost the same concentration, in Stockholm it was twice as much.

EVALUATION RESULTS

- Ongoing measurements since 12-2006 in Dresden, at the other 3 places since 02-2007.
- Comparing UFP 330 and TDMPS: In general, the correlation for the size classes UFP2 – UFP5 is higher than for the largest (< 200 nm) and smallest (20 – 30 nm) one (Jan/2007).
- Correlation between total number concentration UFP 330 (20 – 800 nm) and TDMPS (20 – 400 nm) in Dresden (24/1 – 15/2/07) was good: $R^2 = 0.85$.
- Particle number concentration of UFP 330 to NOx in Dresden shows good correlation $R^2 = 0.83$ (29/1 – 4/2/07) and therefore similar curves in a time series (Fig. 3a). A correlation with NOx indicates traffic influence (Birmili, 2006).
- The change of particle number concentration during an average weekday (24/1–19/3/07) shows the similar pattern like NOx and soot (Fig. 3b).

MEASURING SITES

- Stockholm: Hornsgatan (street canyon)
 - Dresden: Schlesischer Platz (main crossing)
 - Prague: Strahovský tunnel (above tunnel exit)
 - Augsburg: Friedberger Straße (urban background)
- Three places are near busy roads, whereas the place in Augsburg is an urban background site (Fig. 4).

ACKNOWLEDGEMENTS

The authors wish to thank Heinz Ott for providing NOx-data in Augsburg from the routine air measuring network of the Bavarian State Agency of Environment (LfU). The UFIPOLNET-project was made possible with the contribution of the LIFE financial instrument of the European Community: LIFE04 ENV/D/000054.
