

UFIPOLNETnews No. 8 Nov-2006

Dear reader,

here are NEWS for measuring ultrafine particles in ambient air and related subjects.

- 1 Urban Air Pollution a Major Cause of Pollution-related Cancer Science for Environment Policy 9 November, 2006 Issue 42 (EN)
- 2 September 21, 2006 EPA strengthens National Ambient Air Quality Standards for Particle Pollution: annual mean for PM2.5 = 15µg/m³ (EN)
- 3 Nanoparticle Information Library (NIL) by NIOSH (EN)
- 4 COST action 633: Particulate matter: Properties related to health effects documentation available

1 Urban Air Pollution - a Major Cause of Pollution-related Cancer (EN) DG ENV; Science for Environment Policy 9 November, 2006 Issue 42 (EN)

Overall, the available evidence suggests that of all the above-mentioned environmental pollutants, outdoor air pollution and indoor radon exposure are the greatest causes of pollution-related cancer in Europe. The results from this study highlight that air pollution continues to be a serious problem in Europe despite policy efforts. New policies aiming at controlling emissions of air pollutants may be necessary to further protect human health.

Many man-made pollutants have severe negative impacts on human health. The current evidence in Europe linking non-occupational exposure to pollutants with a risk of cancer is very limited.

A new study has reviewed the epidemiological evidence linking exposure to pollutants with a risk of cancer, and has provided a quantitative estimate of the cancer pollutants may cause in Europe. The author considered non-occupational exposure to outdoor air pollution including residence near major industrial emission sources, asbestos, passive smoking, indoor radon, and other sources of indoor air pollution, arsenic in drinking water, chlorination by-products in drinking water, dioxins and electromagnetic fields.

The risk of lung cancer attributable to air pollution, in particular fine particles (PM2.5), the most relevant indicator of air pollution, has been estimated to be 10.7% in Europe, corresponding to 20,942 cases in men and 6,112 cases in women annually. This figure corresponds to 1.9% of all cancer in men and 0.7% in women. Radon is another carcinogen present in indoor air, which may be responsible for 4.5% of lung cancer cases. This figure corresponds to 8,807 cases of cancer in men and 2,570 in women. The author also found that there may be an increased risk of bladder cancer due to water chlorination by-products.

The available evidence of a risk of cancer caused by exposure to other environmental pollutants such as pesticides, dioxins and electromagnetic fields is inconclusive.

Nevertheless, the author calls for great caution when interpreting the available evidence, due to different uncertainties in the components of such quantifications. For example, it is unknown whether PM2.5 represents the measure of air pollution relevant to its carcinogenic potential. They should be considered indicators of the possible order of magnitude of the risk based on current knowledge. More research is needed in order to provide more evidence of the cancer risk from certain pollutants.

UFIPOLNETnews 8 24-Nov-2006

2 September 21, 2006 - EPA strengthens National Ambient Air Quality Standards for Particle Pollution: annual mean for PM2.5 = 15µg/m³ (EN)

EPA has set the following primary (health-related) and secondary (welfare-related): US EPA has established "primary" National Ambient Air Quality Standards (NAAQS) for particulate matter standards to protect public health, and "secondary" standards to protect other aspects of public welfare, such as preventing materials damage, preventing crop and vegetation damage, or assuring visibility.

PM 2.5 (particles with diameters of 2.5	PM 10 (particles with diameters of 10
micrometers or less	micrometers or less)
. annual arithmetic mean of 15 μg/m³	 revoked (no annual arithmetic mean)
. 24-hour average of 35 μg/m ³	 • 24-hour average of 150 μg/m³

These designations would likely become effective in early 2010.

The particulate matter NAAQS were under periodic review. EPA used the results of the latest studies on the health and welfare effects of fine particulate pollution to determine if the standards should be revised or if additional standards are needed. The particulate matter regulatory action web site has the latest information on the proposed revisions:

http://www.epa.gov/air/particles/actions.html

General about Particulate Matter : http://www.epa.gov/pm/

Presentation: http://www.epa.gov/pm/pdfs/20061013_presentation.pdf

On October 6, 2006, EPA released the **Regulatory Impact Analysis (RIA)** for the revised particulate matter national ambient air quality standards. This RIA provides EPA's estimates of the range of the **monetized human health benefits**, control costs, and net benefits associated with meeting the revised suite of standards **for fine particles** (PM2.5) that are published elsewhere in this issue of the Federal Register, as well as for meeting a more stringent alternative. The final rule established a 24-hour standard of 35 g/ m3 and retained the annual standard of 15 g/m3.

http://a257.g.akamaitech.net/7/257/2422/01jan20061800/edocket.access.gpo.gov/2006/pdf/E6-17011.pdf

With regard to primary standards for fine particles (generally referring to particles less than or equal to 2.5 micrometers (μ m) in diameter, PM2.5), **EPA is revising the level of the 24-hour PM2.5 standard to 35 micrograms per cubic meter µg/m3**, providing increased protection against health effects associated with short-term exposure (including premature mortality and increased hospital admissions and emergency room visits), and **retaining the level of the annual PM2.5 standard at 15 µg/m3**, continuing protection against health effects associated with long-term exposure (including premature mortality and development of chronic respiratory disease).

EPA is retaining the 24-hour PM10 standard to protect against the health effects associated with short-term exposure to coarse particles (including hospital admissions for cardiopulmonary diseases, increased respiratory symptoms and possibly premature mortality). Given that the available evidence does not suggest an association between long-term exposure to coarse particles at current ambient levels and health effects, EPA is revoking the annual PM10 standard. 3 Nanoparticle Information Library (NIL) by NIOSH (EN)

The National Institute for Occupational Safety and Health has build up a beta version of a database of research reports about nanoparticles. A short abstract and a picture are shown for every report. You can search by elements and/or structures.
